What is claimed is:

1		1.	A method replaying a portion of a communication, comprising the
2	steps of:		
3		establi	shing a connection between first and second end nodes;
4		receivi	ing, at a buffering module in the connection remote from the first
5	and second end nodes, a communications signal sent from the second end node to the first		
6	end node;		
7		mainta	ining in a memory a segment of the communications signal that was
8	transmitted through the buffering module immediately previous to present time;		
9		receivi	ng at the buffering module a request to retransmit at least a portion
.0	of the segment of the signal; and		
.1		retrans	mitting from the buffering module to the first end node the portion
2	of the segmen	t.	
1		2.	The method of claim 1, wherein at least a portion of the connection
2	is a PSTN, and wherein the step of establishing a connection includes establishing a		
3	circuit-switched path.		
1		3.	The method of claim? wherein the request to retronomit is a
2	touch-tone seq		The method of claim 2, wherein the request to retransmit is a
2	touch-tone seq	luciice.	
1		4.	The method of claim 1, wherein the request to retransmit is an in-
2	band signal.

2

1

2

3

- The method of claim 2, wherein the request to retransmit is an outof-band signal.
- 1 6. The method of claim 1, further comprising the step of receiving at
 2 the buffering module a request to begin maintaining in a memory a segment of the signal.
- 7. The method of claim 1, wherein at least a portion of the connection is a packet switched network.
- 1 8. The method of claim 7, wherein the step of establishing a connection comprises establishing a TCP/IP connection.
 - 9. The method of claim 1, wherein the communications signal is a voice signal, and the segment of the signal is a time segment of the voice signal.
 - 10. The method of claim 1, wherein the connection includes a wireless signal between the first node and the buffering module.
 - 11. The method of claim 1, wherein the connection includes an unreliable portion between the first node and the buffering module.
 - 12. The method of claim 1, wherein the first node is a handheld device selected from a group consisting of a premises telephone station set, a wireless telephone handset and a PDA.
- 1 13. The method of claim 1, wherein the connection includes an audio 2 bridge, and wherein the step of maintaining in memory a segment of the signal comprises

2

1

2

- maintaining in memory a segment of a signal sent by the audio bridge to listening station sets.
- 1 14. The method of claim 1, further comprising the step of, after
- 2 retransmitting the portion of the segment, transmitting the signal to the first end node
- 3 beginning at a point immediately subsequent to the portion of the segment.
- 1 The method of claim 1, further comprising the step of, after
- 2 retransmitting the portion of the segment, transmitting the signal to the first end node
- beginning at a point in the signal received from the second node at present time.
 - 16. The method of claim 1, further comprising the step of storing a record of the retransmitting step in a message record accumulator.
 - 17. The method of claim 1, wherein the request to retransmit received at the buffering module is automatically generated.
 - 18. The method of claim 17, wherein the request is generated upon detection of corrupted data.
- 1 19. The method of claim 17, wherein the request is generated at the 2 first node.
- 1 20. The method of claim 1, wherein the step of receiving a
- 2 communications signal further includes receiving a communications signal sent from the
- 3 first end node to the second end node.

1

2

1

2

- 1 21. The method of claim 1, further comprising the step of transmitting 2 from the buffering module to a memory the portion of the segment.
- 1 22. A method for retransmitting a portion of a communication signal to 2 an end node in a network having an unreliable link, comprising the steps of:
- buffering, at a location in the network on a side of the unreliable link
 opposite the end node, a segment of the communication transmitted immediately previous
 to present time;
- receiving, at said location, a request to retransmit at least a portion of the communication segment; and
- retransmitting the portion of the segment across the unreliable link to the end node.
 - 23. The method of claim 22, wherein the unreliable link is a wireless signal.
 - 24. The method of claim 22, wherein the request to retransmit is a touch-tone sequence.
- 1 25. The method of claim 22, wherein the first node is a handheld 2 device selected from a group consisting of a wireless telephone handset and a PDA.
- The method of claim 22, further comprising the step of storing a record of the retransmitting step in a message record accumulator.

- 1 27. The method of claim 22, wherein the request to retransmit received
- 2 at the buffering module is automatically generated.
- 1 28. The method of claim 27, wherein the request is generated upon
- 2 detection of corrupted data.
- 1 29. The method of claim 27, wherein the request is generated at the
- 2 first node.
